### **FUZZY OLS**

### A. Fuzzy OLS dengan metode max

Berikut merupakan rule yang sudah tidak konflik. Karena terdapat 7 rule, maka banyak parameter yang akan diduga sebanyak 7 rule juga.

| rulejadi = |        |        |        |
|------------|--------|--------|--------|
| 3.0000     | 3.0000 | 2.0000 | 0.0499 |
| 2.0000     | 3.0000 | 2.0000 | 0.6999 |
| 2.0000     | 1.0000 | 2.0000 | 0.3458 |
| 1.0000     | 1.0000 | 2.0000 | 0.7106 |
| 2.0000     | 2.0000 | 2.0000 | 0.8357 |
| 3.0000     | 2.0000 | 3.0000 | 0.3572 |
| 1.0000     | 2.0000 | 1.0000 | 0.6252 |

Model regresi OLS

$$\begin{split} Y_t &= (C_1 \max(\mu_x(R_1) + C_2 \max(\mu_x(R_2) + C_3 \max(\mu_x(R_3) + C_4 \max(\mu_x(R_4) + C_5 \max(\mu_x(R_5) + C_6 \max(\mu_x(R_1)) + C_7 \max(\mu_x(R_7))) / \sum_{i=1}^7 \max(\mu_x(R_i)) \end{split}$$

Atau dapat ditulis dalam bentuk lain yaitu

$$\begin{split} Y_t &= C_1 Z_1 + C_2 Z_2 + C_3 Z_3 + C_4 Z_4 + C_5 Z_5 + C_6 Z_6 + C_7 Z_7 + C_8 Z_8 + C_9 Z_9 + e_i \\ \text{Dengan } Z_i &= \frac{\max(\mu_x(R_i))}{\sum_{i=1}^r \mu_x(R_i)}, i = 1,2,3,\dots r \end{split}$$

1. Berikut merupakan pemilihan maksimum membership diantara dua input. Sehingga akan didapatkan matriks berukuran 94x7.

| 0.0000 | 0.2834 | 0.2757 | 0.0189 | 0.4827 | 0.3326 | 0.385  |

### 3. Pendugaan parameter Fuzzy OLS

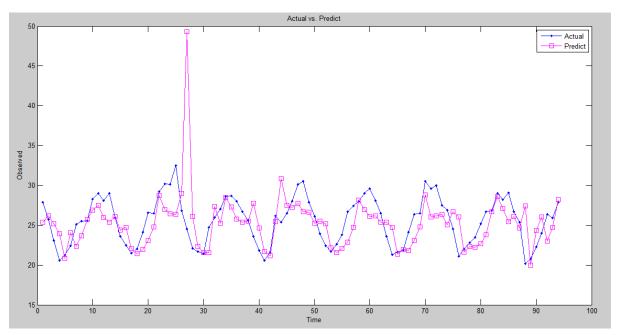

```
Beta =

72.1030
88.3902
5.5550
75.0405
-8.7693
9.5796
3.2750
```

Sehingga didapatkan model regresi tanpa intercept sebagai berikut

```
fit = 72.1*R1 + 88.4*R2 + 5.57*R3 + 75.0*R4 - 8.75*R5 + 9.58*R6 + 3.28*R7
```

Berikut merupakan hasil fiting model dengan data observasi. Dapat dilihat bahwa data prediksi mendekati data observasi, sehingga dapat disimpulkan bahwa model yang terbentuk dapat digunakan peramalan.

### 4. Perhitungan MSE, MAPE dan R-Square

```
\Rightarrow fit = 72.1*R1 + 88.4*R2 + 5.57*R3 + 75.0*R4 - 8.75*R5 + 9.58*R6
+ 3.28* R7;
error=Yt-fit;
%MSE
MSE=sumsqr(error)/n;
MAPE=sum(abs(100*error./Yt))/n;
%R-Square
JKT=sumsqr(Yt)-sum(Yt)/n;
RSquare=1-(sumsqr(error)/JKT);
>> MSE
MSE =
   12.2466
>> MAPE
MAPE =
    8.5176
>> RSquare
RSquare =
```

Berdasarkan hasil perhitungan Error, didapatkan nilai MAPE = 8.5176 dan MSE=12.24 . Model dikatakan baik sebagai peramalan jika nilai MAPE kurang dari 10, sehingga dapat disimpulkan bahwa model tersebut baik digunakan peramalan. Dapat dilihat juga bahwa model dapat menerangkan keragaman data sebesar 98.15%.

### B. Fuzzy OLS dengan metode min

Berikut merupakan rule yang sudah tidak konflik. Karena terdapat 7 rule, maka banyak parameter yang akan diduga sebanyak 7 rule juga.

| rulejadi = |        |        |        |
|------------|--------|--------|--------|
| 3.0000     | 3.0000 | 2.0000 | 0.0499 |
| 2.0000     | 3.0000 | 2.0000 | 0.6999 |
| 2.0000     | 1.0000 | 2.0000 | 0.3458 |
| 1.0000     | 1.0000 | 2.0000 | 0.7106 |
| 2.0000     | 2.0000 | 2.0000 | 0.8357 |
| 3.0000     | 2.0000 | 3.0000 | 0.3572 |
| 1.0000     | 2.0000 | 1.0000 | 0.6252 |

Model regresi OLS

$$Y_t = (C_1 \min(\mu_x(R_1) + C_2 \min(\mu_x(R_2) + C_3 \min(\mu_x(R_3) + C_4 \min(\mu_x(R_4) + C_5 \min(\mu_x(R_5) + C_6 \min(\mu_x(R_1)) + C_7 \min(\mu_x(R_7))) / \sum_{i=1}^7 \min(\mu_x(R_i))$$

Atau dapat ditulis dalam bentuk lain yaitu

$$\begin{split} Y_t &= C_1 Z_1 + C_2 Z_2 + C_3 Z_3 + C_4 Z_4 + C_5 Z_5 + C_6 Z_6 + C_7 Z_7 + C_8 Z_8 + C_9 Z_9 + e_i \\ \text{Dengan } Z_i &= \frac{\min(\mu_x(R_i))}{\sum_{i=1}^r \mu_x(R_i)}, i = 1,2,3,\dots r \end{split}$$

5. Berikut merupakan pemilihan minimum membership diantara dua input. Sehingga akan didapatkan matriks berukuran 94x7.

| InputFix = |        |        |        |        |        |        |

### 7. Pendugaan parameter Fuzzy OLS

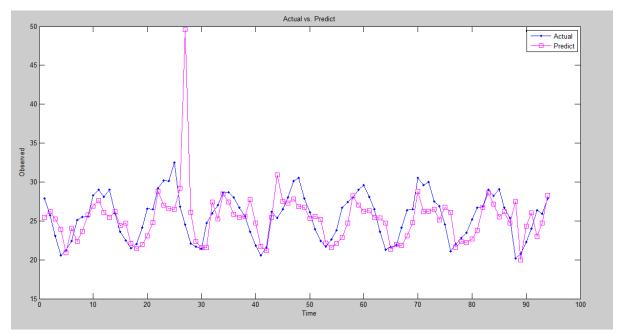

```
Beta =

8.2380
17.2786
0.6479
19.3438
-0.1411
3.1902
1.2017
```

Sehingga didapatkan model regresi tanpa intercept sebagai berikut

```
fit = 8.3*R1 + 17.3*R2 + 0.64*R3 + 19.34*R4 - 0.14*R5 + 3.19*R6 + 1.2* R7
```

Berikut merupakan hasil fiting model dengan data observasi. Dapat dilihat bahwa data prediksi mendekati data observasi, sehingga dapat disimpulkan bahwa model yang terbentuk dapat digunakan peramalan.

### 8. Perhitungan MSE, MAPE dan R-Square

```
>> error=Yt-fit;
%MSE
MSE=sumsqr(error)/n;
%MAPE
MAPE=sum(abs(100*error./Yt))/n;
%R-Square
JKT=sumsqr(Yt)-sum(Yt)/n;
RSquare=1-(sumsqr(error)/JKT);
>> MSE
```

```
MSE =

12.2517

>> MAPE

MAPE =

8.4498

>> RSquare

RSquare =

0.9815
```

Berdasarkan hasil perhitungan Error, didapatkan nilai MAPE = 8.44 dan MSE=12.2517 . Model dikatakan baik sebagai peramalan jika nilai MAPE kurang dari 10, sehingga dapat disimpulkan bahwa model tersebut baik digunakan peramalan. Dapat dilihat juga bahwa model dapat menerangkan keragaman data sebesar 98.15%.

### **KESEMPULAN:**

Berdasarkan hasil ramalan dengan metode Fuzzy Inferense System dan metode Fuzzy OLS, didapatkan bahwa model terbaik yang dapat digunakan peramalan adalah metode Fuzzy OLS karena ramalan mendekati nilai observasi. Sendangkan dengan metode penghubung Max dan Min dihasilkan ramalan yang hampir sama (mendekati). Dapat dilihat juga berdasarkan nilai MSE, MAPE dan Rsquare.
